

Pre-Interview Coding Challenge

CHALLENGE #2

Summary

We have a nested dictionary/Json, we would like a function that you pass in the object and a key and get back the value. How this is implemented is up to you.

Example Inputs

```
object = {"a":{"b":{"c":"d"}}
```

```
key = a/b/c
```

```
value = d
```

```
object = {"x":{"y":{"z":"a"}}
```

```
key = x/y/z
```

```
value = a
```

Hints

We would like to see some tests.

We would expect it in any other language. (Prefer Python)

Please don't use any libraries for this challenge.
